(a)
$\beta = 0.7$, $H = 8$, $L = 64$
Maximum bulk-recurrence discrepancy
Local bounce-back
Stationary balance
Relative-phase flux
Step (phase-only calculation)
(b)
Ghost color, $H = 16$, $t = 8000$
Neutral raw maximum speed
Local bounce-back
Relative-phase flux
Segregation strength, β
(c)
Signed pressure discrepancy (%)
Slit width, H
(d)
Nonneutral residual $\mu U_{max}/\sigma$
Center rotation / BB
Center rotation / flux
Halfway cosine / BB
Halfway cosine / flux
Ghost color / BB
Ghost color / flux
100/(H − 1) estimate (c)
Slit width, H
